

**Finding of No Significant Impact**  
**Eradication of Isolated Populations of Light Brown Apple Moth in California**  
**Revised Environmental Assessment**  
**January, 2008**

The U.S. Department of Agriculture (USDA), Animal and Plant Health Inspection Service (APHIS), has prepared a revised environmental assessment (EA) that analyzes potential environmental consequences of eradicating isolated populations of light brown apple moth (*Epiphyas postvittana*) (LBAM) in California. The EA, incorporated by reference in this document, is available from:

U.S. Department of Agriculture  
Animal and Plant Health Inspection Service  
Plant Protection and Quarantine  
Emergency and Domestic Programs  
Emergency Management  
4700 River Road, Unit 134  
Riverdale, MD 20737-1236

The revised EA analyzed alternatives consisting of (1) maintaining the Federal quarantine order without further action by APHIS (no action alternative), and (2) continuation of the Federal quarantine order along with eradication of isolated populations of LBAM in California with the use of *Bacillus thuringiensis kurstaki* (Btk) and/or LBAM-specific pheromone (treatment alternative). The revised EA evaluated the potential impacts from eradication treatments of small, isolated populations and determined that any potential impacts would be limited. Since the circumstances surrounding each isolated population are unique, each site will be considered in a finding of no significant impact (FONSI) prior to treatment. This FONSI addresses the treatment for LBAM in five separate sites within Half Moon Bay, San Mateo County, California (see attachment 1).

**Treatment in the Half Moon Bay Eradication Area**

Half Moon Bay is a coastal community located approximately 28 miles south of San Francisco and lies within San Mateo County. There are numerous local beaches and parks that provide recreation to the residents and tourists. The city is home to many nurseries and farms.

Five LBAMs have been trapped in Half Moon Bay between May 2007 and September 2007. When an LBAM is found, a treatment area of 200-meter radius surrounding each find is defined. There are five separate treatment blocks within Half Moon Bay (see Attachment 1). The two sites that are located to the west are mainly residential areas and occur a little east of California Highway 1. The other three areas are located off of California Highway 92 and are mainly agricultural areas with few houses.

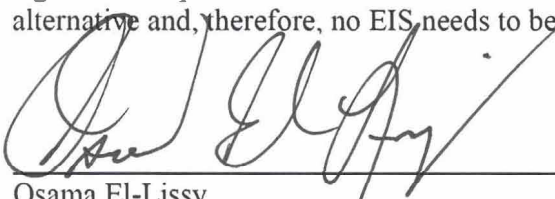

The treatment areas will be treated with pheromone-impregnated twist ties which will be attached to trees, shrubs, and other fixtures within the area at a rate of 250 dispensers per acre. The dispensers will be removed at the end of their useful lives. In some cases they may be replaced for a second treatment. When treatments are completed, all dispensers will be removed.

The revised EA evaluated the potential impacts of eradication treatments of small, isolated populations like the ones in Half Moon Bay. Due to the nature of the dispenser and the pheromone itself, there will be no impacts to the human environment including nontarget species because the product is contained in dispensers that are tied to fixtures and will be removed after treatment. In addition, there will be no negative cumulative effects from this action in combination with any other actions because there are no impacts to the human environment including nontarget species. The most likely impact will be the reduction of the LBAM population due to disruption of mating; eventually leading to the eradication of LBAM within the eradication area, and ultimately, within the State of California.

APHIS and the California Department of Food and Agriculture (CDFA) previously discussed with the U.S. Fish and Wildlife Service (FWS) and the National Marine Fisheries Service (NMFS) treatments with LBAM-specific pheromone at various locations. A no effect determination for listed species and critical habitat has been determined because the pheromones will not affect species other than the LBAM, and the dispensers will be tied to trees and other fixtures that will remain in the treatment areas until removal after 3 months.

There are no disproportionate adverse effects to minorities, low-income populations, or children in accordance with Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations," and Executive Order 13045, "Protection of Children from Environmental Health Risks and Safety Risks."

APHIS' finding of no significant impact for these three treatment areas is based upon the expected limited environmental consequences, as analyzed in the EA. An environmental impact statement (EIS) must be prepared if implementation of the proposed action may significantly affect the quality of the human environment. I have determined that there would be no significant impact to the human environment from the implementation of the treatment alternative and, therefore, no EIS needs to be prepared.
